**Abstract**

During the present study from March 2016 to August 2016, specimens of Hedgehog were randomly selected from different localities of District Jamshoro, Sindh-Pakistan. The food was providing to the captured live specimens 3 times a day where as those free living Hedgehogs may be eating the food of their choice at will. Being nocturnal the Hedgehogs come out of their hides and travel a mile long distance in the search of food. These small mammals make their homes in gardens and under the bushes and stay in their hides in the day time but during winter they come out very seldomly. For the increased population, Hedgehogs need to select long meadow grins, long piles with gaps so that they may create a large leaf piles. The Hedgehogs feed on insects, snakes, frogs, toads, birds, mammalian small babies, eggs and scorpions.
